

GAP ANALYSIS REPORT

Opportunity: Azure DC Migration for Banking Core
Offering: Cloud Migration Factory

Category	Details
Covered	None
Partial Coverage	None
Missing	LLM parsing error

Consultant Narrative

****Gap Assessment:** Core Banking Migration to Azure Cloud**

- ****Scope Alignment**:** The offering provides robust capabilities for automated discovery, landing zone setup, and workload migration templates, aligning well with the client’s goal of moving core banking workloads to Azure. However, the absence of ****LLM parsing error handling**** in data migration or compliance checks introduces a critical gap in ensuring seamless, error-free transitions for sensitive financial data.
- ****Risks**:** Without addressing LLM parsing errors, the client faces potential data integrity issues, compliance breaches, or misaligned workloads during migration. This could lead to operational disruptions, regulatory penalties, or rework costs, especially in a highly regulated banking environment.
- ****Recommendations**:** Integrate LLM error detection and resolution mechanisms into the migration pipeline, particularly for compliance validation and data transformation. Partner with a specialized AI/ML team or leverage Azure’s native tools (e.g., Azure AI) to preemptively identify and mitigate parsing anomalies.
- ****Client Impact**:** Resolving this gap ensures a smoother migration, reduces downtime risks, and strengthens compliance adherence—key for maintaining trust and operational continuity. Proactive mitigation will also future-proof the solution for evolving regulatory demands in cloud-based banking.

***Note:** Prioritize LLM parsing fixes in the project timeline to avoid delays during critical migration phases.*
