

GAP ANALYSIS REPORT

Opportunity: Modernization for Legacy Treasury Platform

Offering: Hybrid Cloud Migration Suite

Category	Details
Covered	Zero downtime during migration High availability with DR cutover Landing zone compliance reviews Automated regression testing
Partial Coverage	Integration with existing banking APIs
Missing	None

Consultant Narrative

****Gap Assessment Narrative: Treasury Management System Modernization****

- ****Scope Alignment**:** The proposed cloud transformation toolkit fully addresses core requirements—zero-downtime migration, multi-region HA/DR, and landing zone compliance—while automated regression testing ensures stability. Partial coverage of banking API integration may require additional validation to avoid post-migration disruptions.

- ****Key Risks**:**
- Legacy system dependencies (e.g., custom banking APIs) could delay testing or introduce unplanned workarounds.
 - Insufficient DR failover testing may expose gaps in regional resilience.
 - Regulatory non-compliance risks if landing zone reviews overlook industry-specific controls.

- ****Recommendations**:**
- Conduct a targeted assessment of banking API integration early to align with migration waves.
 - Implement phased DR drills to validate cutover SLAs before production deployment.
 - Embed compliance checks into CI/CD pipelines for continuous landing zone adherence.

- ****Client Impact**:**
- Minimized operational disruption during migration protects revenue-critical treasury operations.
 - Delays in API integration could extend timelines; proactive mitigation ensures predictable delivery.
 - Post-migration, automated testing and compliance reduce long-term audit overhead.

***Focus areas:** Risk mitigation, timeline predictability, and operational continuity.*
